1. Introduction

This Suppliers' Information Note (SIN) provides service description information about BT IPstream Connect. The IPstream Connect product is a legacy interconnect option for Communications Providers. It forms part of BT's Internet Protocol (IP) Transport Services portfolio (SIN 302).

This SIN should be read in conjunction with SIN 302 detailing BT's Internet Protocol (IP) Transport Services and SIN 485 detailing BT IPstream Connect Office, Home, Max and Max Premium products. If required, this SIN should also be read in conjunction with SIN 496 detailing SID into RADIUS Authentication, SIN 497 detailing SID into RADIUS Accounting and SIN 502 detailing Session Steering.

The following definitions apply throughout this document:

Customer: The Communications Provider (CP) who purchases the BT IPstream Connect service from BT and sells or provides it to End Users. Also referred to as ISP (Internet Service Provider) to differentiate from Content Service Provider.

End User: The person using a device (e.g. PC) to connect to a CP's IP network via the BT IPstream Connect service.

BT Wholesale has launched a product that provides the option to pick up broadband traffic at the IPstream Broadband Remote Access Server (BRAS) node. The interconnect at the BRAS node forms a Equivalence of Input (EoI) point within the service, in addition to the existing EoI point for IPstream consuming SMPF from Openreach..

The IPstream Connect product is made up of two components, the End User Access and the Handover.

The IPstream Connect product gives CP customers the option to take broadband end user traffic off at the BRAS node (via the IPstream Connect Handover component) and transport it to their own or a third party backhaul network.

The following diagram supplies an End to End service overview of the IPstream Connect product.
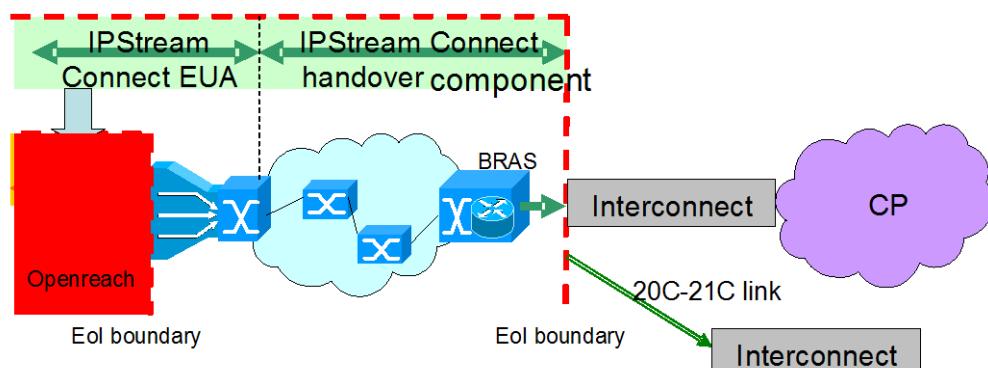

<u>Figure 1. End to End Service Overview</u>

All BT IPstream Connect products are provided on shared infrastructure. The BT IPstream Connect Office /BT IPstream Connect Max Premium products have priority, through the shared part of the BT IPstream Connect network, over the BT IPstream Connect Home /BT IPstream Connect Max products. During a busy period a BT IPstream Connect office or BT IPstream Connect Max Premium product will receive a higher downstream throughput than the equivalent BT IPstream Connect Home or BT IPstream Connect Max product.

BT IPstream Connect Home, Office, Max and Max Premium products present an auto-sensing PPP layer – this will automatically configure itself to the PPP protocol and encapsulation presented by the End User's equipment. The supported combinations are: PPPoA VC-mux, PPPoA LLC/SNAP, PPPoE LLC/SNAP. See SIN 485 for more detail.

BT IPstream Connect enables a Customer to access multiple End Users via interconnects with the BT network at up to 10 locations. The Customer owns the sales, marketing and recruitment of End Users and the contractual/service relationship. BT supplies the delivery transport and basic service.

For further information on the commercial aspects of this service, please refer to:

- Your BT Account Manager
- BT Broadband Helpdesk via e-mail to: broadband.enquiries@bt.com
- BT Wholesale website http://www.btwholesale.com > Broadband community

If you have inquiries relating to this document, then please contact: sinet.helpdesk@bt.com

2. <u>Availability</u>

The BT IPstream Connect End User products are only available over BT provided PSTN Lines (including Wholesale Access). There are also technical reach limitations, which prevents ADSL-carried services being available to End Users beyond approximately 3.5 km from the local exchange for the BT IPstream Connect Home 2000 and BT IPstream Connect Office 2000 products, and beyond approximately 6 km for the BT IPstream Connect Home 1000 and BT IPstream Connect Office 1000 products. However, users on BT IPstream Connect Home 250, BT IPstream Connect Home 500 and BT IPstream Connect Office 500, BT IPstream Connect Max and BT IPstream Connect Max Premium products may be able to obtain service at greater distances from their local exchange.

During the initial order handling process, BT will check the suitability of the line for ADSL services and advise accordingly.

The products are only available in areas where BT has rolled out ADSL exchange equipment.

Some existing telephony based services may be affected by the techniques used to deliver the BT IPstream Connect services over the same metallic line. These include:

- 30k loop
- Private Circuits

- ISDN - all types
- Home Highway or Business Highway
- ISDN - Digital Calls & Access
- ISDN Connect
- RedCare[i]
- FeatureNet 5000 services
- FeatureLine Hunt Groups
- Meter Pulse Facility
- PBX and AUX lines

We can only provide a single BT IPstream Connect service over a single PSTN exchange line.

End Users can only receive a single Broadband Service over a PSTN line.

Please note that this list is not exhaustive. We will endeavour to update this list as new information becomes available.

3. Service Outline

3.1 Overview

BT IPstream Connect consists of a number of access products and the Handover Links.

---
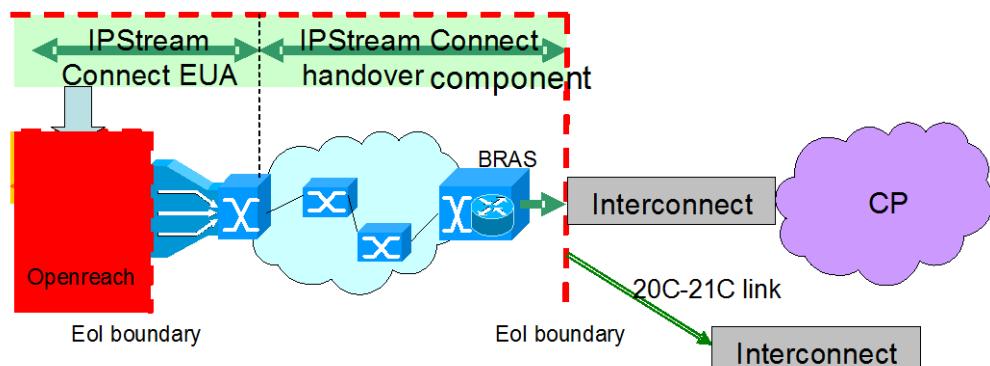

[i] Redcare is being made compatible with ADSL. Call the Redcare General Information Helpdesk on 0800 800 828 for the latest information.

3.2 End User Access Components

BT IPstream Connect End user components provide the link that goes from an End User premises via a dedicated DSL line to the local exchange, to a BT Broadband Access Server in the BT network. The BT IPstream Connect product's Network Termination Point is defined as the End Users-side of the Network Termination Equipment (NTE) installed by BT on the End User premises.

The End user components are provided using ADSL technology which allows a Broadband service to co-exist with the End User's Openreach provided PSTN (or Calls & Access) service.

BT IPstream Connect End user components	NTE / CPE	Installation
Outline	Notes	
BT IPstream Connect Max	No BT provided CPE # - Wires only Product	Self – Install
End User access for a single PC	Rate adaptive to 8Mbit/s Downstream and to 448kbit/s Upstream	
BT IPstream Connect Max Premium	No BT provided CPE # - Wires only Product	Self – Install
End User access for a single PC	Rate adaptive to 8Mbit/s Downstream and to 832kbit/s Upstream	
BT IPstream Connect Home 250	No BT provided CPE # - Wires only Product	Self – Install
End User access for a single PC	Fixed DSL rate downstream of 288k, Rate adaptive upstream DSL bandwidth between 64k and 288k depending on the quality of the end users SMPF.	
BT IPstream Connect Home 500	No BT provided CPE # - Wires only Product	Self – Install
End User access for a single PC	Fixed DSL rate downstream of 576k, Rate adaptive upstream DSL bandwidth between 64k and 288k depending on the quality of the end user's SMPF.	
BT IPstream Connect Home 1000	No BT provided CPE # - Wires only Product	Self – Install
End User access for a single PC	Fixed Rate – 1152k downstream, 288k upstream	

BT IPstream Connect End user components	NTE / CPE	Installation
Outline	Notes	
BT IPstream Connect Home 2000	No BT provided CPE # - Wires only Product	Self – Install
End User access for a single PC	Fixed Rate – 2272k downstream, 288k upstream	
BT IPstream Connect Office 500	No BT provided CPE # - Wires only Product	Self – Install
SOHO, SME access for a small LAN	Fixed DSL rate downstream of 576k, Rate adaptive upstream DSL bandwidth between 64k and 288k depending on the quality of the end user's SMPF.	
BT IPstream Connect Office 1000	No BT provided CPE # - Wires only Product	Self – Install
SOHO, SME access for a small LAN	Fixed Rate – 1152k downstream, 288k upstream	
BT IPstream Connect Office 2000	No BT provided CPE # - Wires only Product	Self – Install
SOHO, SME access for a small LAN	Fixed Rate – 2272k downstream, 288k upstream	

Table 1 End User Components – ADSL Technology

3.3 IPstream Connect Handover Component

3.3.1 Overview

The Handover provides a means of conveying traffic from IPstream Connect end users to the IPstream Connect Point of Service Interconnects.

3.3.2 Commercial arrangements

The CP is required to order only one Handover – this covers connectivity from all of that CP's interconnects to all of its end users nationwide (10 x 20C connections). A CP will need to contract for a minimum bandwidth of 500Mbit/s for the Handover component. Bandwidth is purchased at each node in blocks of 1Mbit/s (1 Million bits per second).

The CP is required to purchase sufficient blocks of bandwidth to cover the bandwidth used by their end users. BTW will measure the bandwidth used by a CP per node. If the bandwidth used exceeds the bandwidth for which the CP has entered into contract, then they will incur a bursting bandwidth charge. BTW will have one charge for bandwidth, irrespective of the type of traffic passed (there are no IP DSCP priority marking specific charging schemes). BTW will not actively police the bandwidth to the contracted bandwidth purchased by the CP; it is the responsibility of the CP to ensure that if it wishes the bandwidth to be constrained or restricted then it will need to employ traffic management / control on its broadband traffic before the traffic enters BTW's network.

3.3.3 IPstream Connect Handover interconnect options:

The EoI boundary for the IPstream Connect product is at the IPstream Connect BRAS nodes. Some of these nodes are not part of the 21C network whilst others are in buildings that serve both the legacy 20C IPstream network and the new 21C Network. To avoid forcing CPs to build out to legacy network locations and to help align the IPstream Connect product with WBC, BTW will provide the option of interconnect links between the legacy BRAS nodes and the nearest 21CN node. CPs wishing to purchase the IPstream Connect product therefore have the option of connecting at the BRAS nodes or connecting at the nearest 21C node. The following table summarises the connectivity locations:

20CN BRAS Node	21CN BB POSI Site
Kingston (SEC)	Kingston (TEC)
Faraday	Faraday
Ealing	Colindale
Ilford	Stepney
Reading	Slough
Milton Keynes	Milton Keynes
Birmingham	Birmingham
Sheffield	Sheffield
Manchester	Manchester
Edinburgh (20C)	Edinburgh (21C)

Table 2 Connectivity Locations

For each BRAS node the CP can choose to take a 20C connection option in the same building as the BRAS, in which case BTW will provide a connection to a suitable patch panel to facilitate the interconnection into the CP's network, or the CP can choose to take a 21C connection option, in which case BTW will provide an interconnection between the 20C and 21C locations and interconnect to the CP's MSIL product at the corresponding 21CN node. Any of the available MSIL variants can be used for the 21C connectivity option (e.g. in-span, in building handover). Please refer to the MSIL Product Handbook [7] for more details.

The CP is required to have some form of interconnect to all of the BRAS nodes to offer service to IPstream Connect end user accesses; this is via 10 x 20C connectivity.

In order to provide a resilient service, BTW will deploy two routers at each BRAS node in order to aggregate the traffic before presenting it for handover to a customer's network. Where the CP takes a 20C connectivity option, the traffic will be presented over fibres from each of the routers. As such the service mandates that one or more pairs of fibres will be used for interconnection to the CP. The traffic over these fibres is carried in Ethernet running at 1Gbit/s or 10Gbit/s speeds. Where multiple pairs of fibres are used, Line Aggregation Group (LAG) can be selected to operate over the fibres from each router within the BTW network.

For the 21C connectivity option, the same rules apply for the speed and dimensioning of fibre interconnect and BTW will deploy 20CN to 21CN interconnect links in pairs. However, because the use of MSIL means that the L2 device connecting to each BTW BRAS aggregation router cannot be guaranteed to be the same device, it is not possible to offer a LAG option for the 21CN connectivity.

Although the product presents a pair of fibres at the 21CN interconnect node, the CP can elect to have the fibres connected into the same MSIL, or connected into separate MSIL's. Traffic from a pair of interconnect links will be presented within a pair of IPstream Connect specific VLANs over the MSIL(s).

Notes:

1) There is a limit of 8x1G or 8x10G pairs of handover links at each handover node.

2) Due to the implications of a link failure if the links were not equal size, the CP must purchase handover links of equal size (1G or 10G) at a given handover node. It is not possible to mix sizes.

3.3.4   Features of the Handover Component

The Handover component is available in 'PPP pass through' and IP presentation options. For both variants, the CP is required to specify one or more Service Selection Names (SSNs) to associate with their infrastructure. This SSN enables BTW to map end users to the interconnect owned by the correct CP. The SSN is a character string that will be matched against the characters presented in the user-Id of the end user's CHAP authentication request beyond the "@" symbol.

Example:

A user has its CPE router configured to login with a username and password.

If the username specified is Joe.Bloggs@**mysteryCP.co.uk**, the bold characters equate to the service selection name (SSN).

The CP has the option of receiving RADIUS authentication and accounting packets for the IPstream Connect product. The service supports up to 3 CP Authentication RADIUS servers, and up to 2 Accounting RADIUS servers. The necessary details are captured on the RADIUS section of the Handover CRF.

If the CP does not wish to receive RADIUS authentication packets then BTW will take the following actions, depending on the SSN type:

- For SSNs configured as PTA mode only, the end user's PPP setup requests will be default accepted and an IP address dynamically assigned to the end user from the CP's pool on the end users BRAS.

- For SSNs configured as L2TP only, the end user's PPP session will be tunnelled to one of the tunnel end points associated with that SSN. BTW will attempt to send an equal number of PPP sessions to each tunnel end point associated with an SSN.

- By their nature, mixed PTA and L2TP SSNs are not possible without a CP authentication RADIUS, as a RADIUS response is required to inform the BTW platform of the appropriate action to take for the end user. Similarly the PTA Mode Multiple Address Pool functionality (see Section 4) requires a CP authentication RADIUS.

If the CP wishes to receive RADIUS authentication packets, then each session setup request can be forwarded to the CP RADIUS. The CP RADIUS response can then be used to reject or accept the session, with the end user's PPP session either tunnelled into the CP network or terminated on the BRAS depending on the exact nature of the RADIUS response. The CP is responsible for ensuring that there is a route from the IPstream Connect network to the CP's RADIUS. The CP has the option of advertising a route to the RADIUS through one or more of the interconnects to the IPstream Connect network or using the internet to facilitate the connection.

The Premium Forwarding traffic class was introduced for Content Connect and uses the DSCP marking AF31. Any IPstream Connect traffic marked with AF31 will be re-marked by IPstream Connect as Best Efforts. In the case of L2TP traffic, the re-marking will be performed on the outer (L2TP carrying) DSCP marking.

3.3.5 Physical presentation

20C interconnect option:

The Customer traffic will be via pairs of fibres running 1Gbit/s or 10Gbit/s Ethernet interfaces presented on a patch panel for which rack space will need to be allocated within the Customer's enclosure.

The standard patch panel presents SC type fibre connectors. The Patch Panel itself does not restrict usage to a particular fibre type (i.e. Multi Mode or Single Mode) but BTW will be placing the following restrictions on the fibre type:

- for 1Gbit/s the customer can request either single mode or multi mode fibre
- for 10Gbit/s the only option is for single mode fibre

For the 20C interconnect option, the customer can select for autonegotiation for speed and duplex to be either on or off

21C interconnect option:

At present, the IPstream Connect product supports MSIL handoff only at the 21C interconnect nodes. Any available variant of MSIL can be used (e.g. in-building handover, in-span handover). The physical presentation of the MSIL product is defined in the relevant MSIL Product Handbook[7].

3.3.6 Routing Protocols

For each fibre (or fibre group where LAG is used at a 20C interconnect node) the CP is required to provide 2 RIPE registered public IP addresses; one for each end of the link. BTW will establish a BGP session with the IP device on the customer end of each fibre. The customer can advertise previously agreed tunnel end point addresses into BTW's network using this BGP session. The customer cannot advertise a default route. The customer is required to ensure that all tunnel end point addresses are advertised into each interconnect node. There is a limit of 2000 to the number of prefixes that the customer can advertise into BTW through the BGP session. If the customer exceeds this amount, the BGP session will be brought down. For L2TP traffic, where the same tunnel end point address is advertised down two separate fibres into the same interconnect node, BTW will honour any routing cost (MED) advertised with the route such that load shared or main-standby configurations can be used; this is provided that the routes are equally specific, else the more specific route will take priority for routing traffic into the CP's network. For PTA traffic, upstream traffic cannot be influenced by MEDs & upstream PTA traffic will be load-balanced across the BGP peerings at the POSI site. BTW will set hello, dead and routing advertisement BGP timers as 10 seconds, 30 seconds and 5 seconds respectively.

Notes:

1) Where public registered RIPE IP addresses are required from the CP for the IPstream Connect product, the addresses provided must be IPv4 addresses.

2) The L2TP protocol uses the presence of L2TP control traffic including L2TP keepalive (hello) acknowledgements to detect network problems and control tunnel and session state. In order to ensure that working L2TP tunnels are not dropped by IPstream Connect BRASes, CPs must respond to L2TP control packets. CPs should ensure that all L2TP control packets (including hello acknowledgements) are prioritised, to avoid dropping. If these control packets are dropped by the CPs network, this may cause tunnel failures and adversely affect their service.

16 bit vs 32 bit AS Numbers

The IPstream Connect product currently supports 16 bit AS numbers only. RIPE has stated that from January 2010 it will no longer issue 16 bit AS numbers, but will operate AS Number assignments from an undifferentiated 32-bit AS Number allocation pool. Any CP planning to use a new AS number is therefore advised to apply for a 16 bit number before January 2010. BT will monitor the requirement after January 2010. If IPstream Connect supports 32 bit ASNs in the future, this will be reflected in an updated SIN.

3.3.7 Handover Link Tagging

IPstream Connect offers a Handover Link Tagging option which can be used by customers to control the routing of their downstream traffic under failure. If this option is chosen, a specific private IP address is advertised via eBGP over each of the CP's IPstream Connect handover links. The CP can use the presence/absence of these addresses to make routing decisions.

Note: These addresses will be for link failure detection only, all traffic destined for these addresses will be routed to null / discarded.

The private IP addresses will be allocated by BT and advised to the CP. If there is a clash with the CP's current addressing, BT will need to be advised so that an alternative range can be chosen.

4. End user authentication and establishing a PPP session

4.1 General

PPP is used to obtain IP addresses from the Customer's address pool on a per-session basis. Please note that only one PPP session per End User DSL service is allowed; multiple sessions are not supported. As mentioned in section 3, the IPstream Connect product supports IP and L2TP presentation options.

For IP presentation (PTA Mode), the PPP session is terminated within the BTW network and an IP address assigned from a pool of IP addresses provided by the CP.

IPstream Connect is introducing the ability for a CP to use Multiple Address Pools for their PTA Mode service. This is optional & requested via the CRF. The CP will provide a set of Pool Names and the associated IP Address ranges for each pool. During the RADIUS authentication stage for end user sessions, the CP will return the required Pool Name and a Dynamic IP address from the chosen pool will be allocated to the End User.

Notes:

- The IP addresses must be public, RIPE registered addresses;
- The minimum pool size is 65K addresses;
- IP address pools can be made up of a number of address blocks. The minimum accepted IP address block size for IP presentation is a /18 (/16's are preferred);
- The addresses will be allocated to IPstream Connect BRAS nodes by BT in /21 or /22 blocks, depending on the expected pool size;
- At present it is not possible to use the same Pool Name on WBC and IPstream Connect. In addition Multiple Address Pools are not currently supported on mixed (PTA/L2TP) SSNs. These limitations will be addressed at a later date.

For the L2TP presentation option, the BTW network will tunnel the end user's PPP session into the CP's network using L2TP. The CP then has the responsibility to terminate the PPP session and assign an IP address.

Notes:

- tunnel end point addresses provided by the CP must be public, RIPE registered addresses;
- The CP specifies a Tunnel Name for the tunnels associated with a Service Selection Name. Tunnel Names may be different for each Service Selection Name, however the Tunnel Name must be the same for all tunnels that are destined for a given Tunnel End Point IP Address.

BT IPstream Connect supports the features of Service Selection Barring and Limited Service Selection. At the time of ordering the CP can specify one or more service selection names to associate with an end user.

Service Selection Barring is used to prevent end users attempting to log on to a service selection name that the end user does not have permission to access, whilst Limited Service Selection is where the CP has associated more than one Service Selection name to the end user and so the end user can log in to alternative service selection names, within a maximum of 5 names.

In the case of Limited Service Selection, the service selection names can even be owned and attached to a network operated by a third party company provided the appropriate LSS authorisation forms are completed detailing permission by the third party to allow the CP to direct end users to the third party network.

The sequence of events to establish a PPP session depends on the authentication option that the CP has selected at the time of ordering the handover component product and the service selection name that the end user presents in their login attempt. It is possible for a CP to specify a different authentication mechanism for each service selection name that it operates.

4.2 Authentication Options

IPstream Connect offers a number of Authentication options:

- Default Accept, PTA mode;
- PTA Mode with Authentication/ SID Authentication;
- PPP passthrough (L2TP) with BT selected Tunnel End Point;
- PPP passthrough (L2TP) with CP Session Steering to the CPs selected Tunnel End Point;
- Mixed SSN, PTA or L2TP determined by the CP.

For the L2TP Session Steering option, please refer to SIN 502 [12].

SID for Authentication is an option for PTA and L2TP passthrough. For more information on SID for Authentication, please refer to SIN 496.

4.2.1 Default Accept, PTA mode

This is used where the CP does not wish to authenticate an end user's setup request and is happy for the end users PPP session to be terminated within BTW's network and assigned an IP address at random from the pool of IP addresses provided by the CP to BTW for this purpose. No interaction with the CP's RADIUS is required, the end user traffic will be source address routed to force the traffic down the CP's handover component interconnects and end user traffic will be presented as routed IP to the CP. To enable this option, the CP should:

- specify PTA mode on the Handover component CRF against one or more SSNs,
- specify a pool of IP addresses to be used for their end users, and
- indicate that RADIUS authentication is not required.

Note that LSS and SSB will still be applied to this end user.

4.2.2 PTA Mode with authentication / SID authentication

This is used where the CP wishes the end user to be assigned an IP address at random from a pool provided to BTW to host on the BTW network but wishes to authenticate the user first. The CP is required to provide a RADIUS for the BTW network to interact with. The CP's RADIUS will receive authentication requests in the following format:

Attribute Number	Attribute Name	Attribute Content
1	User-Name	User@domain or domain/user
2	User-Password	Password
3	CHAP-Password	Password
4	NAS-IP-Address	<NTE_Router_IP_Address>
5	NAS-Port	NTE Router Port
6	Service-Type	Framed
7	Framed-Protocol	PPP
26	Vendor Specific	
32	NAS identifier	
33	Proxy-State	<determined by RADIUS>
61	NAS port type	
87	NAS port id	
31	Calling Station ID	
60	CHAP challenge	

Table 3 Authentication Request Format

Notes:

1. NAS-IP-Address and NAS-Port are maintained but amended for security reasons.

2. The Customer RADIUS servers should recognise the specified format and values of Attribute 26 variant, Enterprise Code 594, Enterprise Tag 1 (containing '594:1:"Platform Authentication"').

3. According to IETF RFC2865 an access request MUST contain a NAS-IP-Address (4) or a NAS-Identifier (32) or both.

4. According to IETF RFC2869 an access request should contain either a NAS-Port (5) or a NAS-Port-Id (87).

5. Attribute 31, Calling-Station-Id, will be used for populating the Service ID (SID). This field will take the form "FTIP<numeric>" or "BBIP<numeric>". In some instances the SID may be post fixed by a sequence containing a port ID in which case the attribute will take the form of "FTIP<numeric>:IPIA<numeric>" or BBIP<numeric>:IPIA<numeric>". The SID is the end user identifier used in the IPstream Connect EUA provision and reporting interfaces.

6. Attribute 60, CHAP-Challenge may be populated for requests depending on the source equipment within BT Wholesales platform.

7. Either User-Password or CHAP-Password will be supplied in the request, not both

To enable this option, a CP should:

- specify PTA mode on the Handover component CRF against one or more SSNs,
- specify one or more pools of IP addresses to be used for their end users,
- indicate that RADIUS authentication is required and provide the necessary RADIUS details (RADIUS IP address(es), UDP port to use, accept or reject if RADIUS unavailable) and
- indicate if SID authentication is also required, in which case attribute 31 will contain the Service ID as stated in note 5 above. See SIN 496 for more details.

The CP RADIUS is required to respond with an access accept / reject message:

An access accept message contains the following attributes:

ATTRIBUTE_NUMBER	ATTRIBUTE_NAME	ATTRIBUTE_CONTENT	MANDATORY
6	Service-Type	Framed	*Yes*
7	Framed-Protocol	PPP	*Yes*
8	Framed-IP_Address	Customer Administered IP Address	***No***
11	Filter-Id	Static or Dynamic Filters	***No***
22	Framed-Route	Used for No-NAT routing updates	***No***
25	Class	<string> to appear in all Accounting-Requests associated with the session	***No***
27	Session Timeout	Minimum Supported 7200 seconds	***No***
28	Idle Timeout	Minimum Supported 7200 seconds	***No***
33	Proxy-State	<determined by RADIUS>	***No***
88[1]	Framed-Pool	Pool Name	***No***

Table 4 Access Accept Message Attributes (PTA Mode with authentication / SID authentication)

Note:

1. If the CP has chosen the Multiple Address Pool option for their PTA traffic, a Framed-Pool containing the correct Pool Name to allocate to the end user must be returned. If the CP does not require the Multiple Address Pool option, this attribute is not required.

In the event that the end user is denied service, an Access Reject message is returned by the customer RADIUS. The proxy-state attribute may be returned in the Access Reject message. No other attributes are required.

4.2.3 Always PPP passthrough (L2TP) with BT selected tunnel end point

This option is for when the CP wishes end users logging in to a particular SSN or set of SSNs to always have the PPP session tunnelled to a pre-defined set of tunnel end points within the CP's network. For this option there is no interaction with the BTW RADIUS servers, however the CP still has the option of authenticating the user when the PPP session request arrives at the LNS within the CP's network. The CP is required to supply a list of one or more tunnel end points (up to maximum of 400) to associate with each SSN.

To enable this option the CP should:

- set L2TP as the service type against the SSN(s),
- specify no BT RADIUS authentication required,
- specify a list of tunnel end points to associate with each SSN and
- implement an authentication process within their own network as required

4.2.4 Mixed SSN, PTA or L2TP determined by CP

This option is typically used where customers have a mix of dynamic IP addressed users and fixed / static IP addressed users within the same SSN. An interaction between the CP and BTW RADIUS is used on each end user authentication request, with the response from the CP RADIUS determining whether the end user has an IP address assigned from a pool hosted on the BRAS or whether the end user is tunnelled to a pre-defined list of tunnel end points within the CP's network.

The CP will be presented with an access request for each login attempt containing the following attributes:

Attribute Number	Attribute Name	Attribute Content
1	User-Name	User@domain or domain/user
2	User-Password	Password
3	CHAP-Password	Password
4	NAS-IP-Address	<NTE_Router_IP_Address>
5	NAS-Port	NTE Router Port
6	Service-Type	Framed
7	Framed-Protocol	PPP
26	Vendor Specific	
32	NAS identifier	
33	Proxy-State	<determined by RADIUS>
61	NAS port type	
87	NAS port id	
31	Calling Station ID	
60	CHAP challenge	

Table 5 Access Request Attributes (Mixed SSN, PTA or L2TP determined by CP)

The CP RADIUS is required to respond with an access accept message as follows:

ATTRIBUTE_NUMBER	ATTRIBUTE_NAME	ATTRIBUTE_CONTENT	MANDATORY
6	Service-Type	Framed	*Yes*
7	Framed-Protocol	PPP	*Yes*
8	Framed-IP_Address	Customer Administered IP Address	*No*
11	Filter-Id	Static or Dynamic Filters	*No*
22	Framed-Route	Used for No-NAT routing updates	*No*
25	Class	<string> to appear in all Accounting-Requests associated with the session	*No*
27	Session Timeout[1]	Minimum Supported 7200 seconds	*No*
28	Idle Timeout[1]	Minimum Supported 7200 seconds	*No*
33	Proxy-State	<determined by RADIUS>	*No*
88[2]	Framed-Pool	Pool name	*No*

Table 6 Access Accept Message Attributes (Mixed SSN, PTA or L2TP determined by CP)

Note:
1. The session & idle timeouts are only relevant for PTA mode end users.
2. If the CP has chosen the Multiple Address Pool option, a Framed-Pool containing the correct Pool Name to allocate to the end user must be returned. If the CP does not require the Multiple Address Pool option, this attribute is not required.

If the CP populates attribute 8 – Framed-IP Address or attribute 22 – Framed-Route, then the BT Wholesale RADIUS will tunnel the end user's PPP session. The address value passed back in the attribute is not used as the tunnel end point, it is simply used as a trigger to tunnel the session. The tunnel will be set-up to a pre-defined tunnel end point associated with the service selection name presented by the end user during the PPP session setup attempt.

If the CP responds but leaves attributes 8 and 22 blank, then the end user's PPP session will be terminated within BTW's network and assigned an IP address at random from the pool of IP addresses provided by the CP to BTW for this purpose.

In the event that the end user is denied service, an Access Reject message is returned by the customer RADIUS. The proxy-state attribute may be returned in the Access Reject message. No other attributes are required.

4.3 RADIUS accounting options

The CP can opt for one of the following RADIUS accounting options. This is in addition to any RADIUS accounting options that the CP may implement in their own network e.g. for PPP pass-through users terminated on a CP-owned LNS.

The RADIUS accounting data transfer attributes (42, 43, 47 and 48) have a level of accuracy comparable with typical IP traffic measurement equipment. However there are circumstances under which accounting packets and records may be lost. The traffic measurements are therefore an approximate indication of the individual end user traffic.

The format of the RADIUS accounting data generated by BTW is as specified in the following table:

Attribute	Value	Type of Value	Start	Interim[4] (Option)	Stop
User-Name	1	string	✔	✔	✔
NAS-IP-Address[1]	4	integer	✔	✔	✔
NAS-Port[1]	5	integer	✔	✔	✔
Service-Type	6	integer	✔	✔	✔
Framed-Protocol	7	integer	✔	✔	✔
Framed-IP-Address[2]	8	integer	✔	✔	✔
Class[3]	25	string	✔	✔	✔

Proxy-State	33	string	✔	✔	✔
Acct-Status-Type	40	integer	✔	✔	✔
Acct-Delay-Time	41	integer	✔	✔	✔
Acct-Input-Octets	42	integer		✔	✔
Acct-Output-Octets	43	integer		✔	✔
Acct-Session-Id	44	string	✔	✔	✔
Acct-Authentic	45	integer	✔	✔	✔
Acct-Session-Time	46	integer		✔	✔
Acct-Input-Packets	47	integer		✔	✔
Acct-Output-Packets	48	integer		✔	✔
Acct-Terminate-Cause	49	integer			✔
Acct-Input-Gigawords	52	integer		✔	✔
Acct-Output-Gigawords	53	integer		✔	✔
NAS-Port-Type	61	integer	✔	✔	✔

Table 7 RADIUS Accounting Data Format

Notes:

1. NAS-IP-Address and NAS-Port are maintained but amended for security reasons.

2. Framed-IP-Address (Attribute 8) is only present in Accounting for PTA Mode End Users.

3. a) It is possible to have multiple Class attributes in accounting requests.
   b) Currently the IPstream Connect service does not support the presence of a null (hex 00) in the Class Attribute (attribute 25) string. If a null is used in attribute 25 in the access-accept, the string that appears in the accounting requests for the session may be truncated at the null.

4. The interim accounting period is two hours.

Accounting options:

- No BTW RADIUS accounting presented to the CP

The above accounting data is not presented to the CP

- Accounting with dual delivery or round robin

Where the dual delivery option is selected, data is sent to both separate CP server IP addresses. Where the Round robin option is selected and two CP server IP addresses are specified, BTW will send 2/3 of the accounting data to the first server IP address and 1/3 to the second. Where the Round robin option is selected and one CP server IP address is specified, BTW will send all accounting data to the server IP address. With either dual delivery or round robin options, the RADIUS accounting data is sent on a fire and forget basis.

- Accounting with geographic based delivery

For each BRAS location the CP can specify a server IP address, accounting data from that BRAS node is then presented to that server IP address. This option can be used in conjunction with the dual delivery or round robin option to deliver one accounting packet to an IP address based on BRAS location and a duplicate to an alternate IP address irrespective of BRAS location. With this option, the delivery of accounting data is on a fire and forget basis.

- SID into accounting

If this option is selected, the CP will be presented with the Service ID of the end user in attribute 31 (Calling-Station-Id) for each accounting packet. See SIN 497 for more details.

4.4 RADIUS setup and routing

The CP is responsible for ensuring that there is a route from the IPstream Connect network to the CP's RADIUS. The CP has the option of advertising a route to the RADIUS through one or more of the interconnects to the IPstream Connect network using the BGP sessions established across the interconnect links between the CP's and BTW's routers. This is BTW's preferred method of communication with the CP's RADIUS servers. If the CP does not advertise the RADIUS address through any of the interconnects, then BTW will route the RADIUS traffic on to the internet in order to facilitate the connection - this should only be considered where the customer's internet peering connectivity is trusted.

Note: For all routing methods to the CP's RADIUS, the RADIUS addresses provided by the CP must be public registered RIPE addresses.

4.5 RADIUS standards

The Customer's RADIUS Server must conditionally or unconditionally, comply with RFC 2865 "Remote Authentication Dial In User Service (RADIUS)", 2866 "RADIUS Accounting", 2867 "RADIUS Accounting Modifications for Tunnel Protocol Support", 2868 "RADIUS Attributes for Tunnel Protocol Support" and 2869 "RADIUS Extensions" where applicable to the type of service required.

It should be noted that the value of the Response Authenticator field in Access-Accept, Access-Reject and Access-Challenge packets will be constructed in the form stated in RFC2865:

"ResponseAuth = MD5 (Code+ID+Length+RequestAuth+Attributes+Secret_ where + denotes concatenation"

RADIUS operation will consist of an Access-Request generated by the LAC or Home Gateway Router and forwarded the Customer's RADIUS server. The Customer's RADIUS Server must conditionally or unconditionally comply with the relevant RFC.

4.6 Presentation Domain (How the domain is presented to the Service Provider)

4.6.1 Format Options

This is how the username and domain name is presented to the Customer in the RADIUS Access requests. There are two formats available, listed below.

- **Default Domain Name**

  Two formats of presenting the domain name and user name are supported. These are:

  End.user@link.business-name.com

  Link.business-name.com/end.user

  Please note:

  - *The characters '!', '/', '\', '%''@' and '#' are reserved characters and can not be used within a username or domain name.*

  - *It is possible for Customers to receive "domain/user" even if they are expecting "user@domain". How this is processed is up to the Customer.*

  Please note that the Virtual Domain Name option (presented below) is not compatible with the '/' delimiter Domain Name format.

- **Virtual Domain Names**

  This option will allow a portion of the username to be included in the domain name of the IPstream Connect service.

  For example, a Customer with a domain name of '*sp.com*' (configured as a virtual domain), and a user with a username of Fred Smith who works for Acme will have *fred.smith@acme.sp.com* presented to their RADIUS. This could be used for example by groups of end users using multiple mailboxes from a single connection e.g. different first names for a family connection, employees of a company, or groups of end users who wish to retain their company identity when having service delivered by a 3rd party network provider.

  With Virtual Domain Names everything to the left of the first '.' in the Domain Name is treated as a wildcard, everything to the right of the first '.' is treated as the selecting Domain Name (the Domain Name entered on the End User CRF). E.g. in:-

  fred@bloggs.isp.com

  "fred" is the username

"bloggs" is the wildcard

"isp.com" is the selecting domain name.

Where a customer's domain name is configured as a virtual domain name, BT's network has been configured to accept an End User login *with or without* the 'wildcard' element of the virtual domain name. From the first example, both *fred.smith@acme.sp.com* and *fred.smith@sp.com* would be valid. However, this functionality is dependent on an acceptable format for the selecting domain name.

Acceptable formats of the selecting domain name on the virtual domain order request are shown in the following examples.

Example 1. *"isp.com"*, *"isp.net"* etc, *which* allows end users to login **with or without a wildcard** preceding the selecting domain name (*isp.com*)

e.g. allowing logins of *fred@bloggs.isp.com* OR *fred@isp.com* (where *bloggs* is a wildcard)

Example 2. *"isp"* where the end user of that customer **will be using a wildcard** [separated from the selecting domain name by a "." (dot)] to precede the selecting domain name as part of the end user login

e.g. allowing a login of *fred@bloggs.isp* (where *bloggs* is the wildcard)

Please note that the login *fred@isp* **will not work**, where the selecting domain name is in the format *"isp"* i.e. with no '.' (dot) in the selecting domain name.

4.6.2 Username and Domain Name length

The maximum length of the combined username and Domain Name string is 253 characters (including the separator).

The maximum length of a Domain Name is 32 characters (applies to everything to the right of the first '.' if the Virtual Domain Name option is selected).

4.7 Test User Account

For testing purposes, BTW requires that CPs purchasing the IPstream Connect handover product provide a test end user account per service selection name configured. This should be of the format bt_test_user@service_selection_name, where service_selection_name is the CP's normal service selection name. Please see section 5 for more details on test and diagnostic considerations for CPs purchasing IPStream Connect.

4.8 Session Handling under failure

If the BT IPstream Connect Service loses all connectivity with the Customer's RADIUS server, then the BTW platform will mark the CP's RADIUS server as "dead" and will not send any authentication requests to that server for 10 minutes. If all CP RADIUS servers are unavailable, then end users logging into service selection names that require CP RADIUS authentication will not be able to gain service.

4.9 PPPoE support and MTU size

The maximum MTU size on the BT Broadband network is 1500 bytes – the IPstream Connect infrastructure ensures that End User data packets up to and including this size are carried without fragmentation.

This applies at the layer being carried by IPstream PPP. If tunnelling protocols (such as PPTP or IPSEC) are being used over this connection then customers should advise end users to configure the MTU on these higher layers correspondingly smaller in order to ensure that the packets being carried by the IPstream PPP layer do not exceed 1500 bytes.

For PTA end users using PPPoE, the following steps occur within the end user authentication process:

PPPoE clients should behave as per RFC2516 and RFC1661 – if so:

- PPPoE End User client should send an MRU of 1492 Bytes or less to the BTW BRAS.
- The BTW BRAS will send an MRU of 1492 Bytes to the PPPoE client.
- The PPPoE client and BTW BRAS will agree on the lower value MRU.
- The BTW BRAS will advertise this as an IP MTU towards the Internet of 1492 Bytes (or lower if the client asked) for PPPoE End Users.
- The BTW BRAS will continue to advertise 1500 Byte IP MTU for PPPoA End Users.
- The DF bit on IP packets will be obeyed, not ignored or overwritten, so IP packets over 1492 Bytes to PPPoE End Users with the DF bit set will be dropped.
- A message will be sent back to the server using ICMP stating the maximum packet size of 1492 Bytes.

If the PPPoE client does not obey RFC2516 and RFC1661 (which occurs regularly), one of two circumstances will occur:

- If the PPPoE client does not send an MRU, but agrees the BTW BRAS MRU of 1492 Bytes, then the BTW BRAS will advertise this as the IP MTU for that End User to the Customer.
- If the PPPoE client and BTW BRAS do not agree a valid MRU, then the BTW BRAS will default to advertising a value of 1500 Bytes as the IP MTU for that End User to the Customer.

If the End Users PC is behind the device raising the PPPoE session (for example on a routed LAN), then the IP MTU of the PC must be set to 1492 Bytes or lower.

For L2TP end users, the behaviour is the same with the addition that the BRAS will proxy on the MRU value to the LNS device in the CP's network.

5. IPStream Connect diagnostic options

5.1 General

There are two areas that need additional consideration with regards to diagnosing end user problems when purchasing IPstream Connect.

5.2 xDSL IP test

The first area is the xDSL IP test. This test attempts to run a ping test between the end user's router / modem and the PPP termination point within the network. Depending on the type of service that the CP has opted for the end user's PPP session may terminate within the BT network at the BRAS (e.g. for PTA mode end users) or the session may be tunnelled into the CP's network where it is terminated (LAC mode of operation for the BRAS).

The xDSL IP test forms part of the WOOSH one shot check. When instigated, the xDSL IP test will first query the BRAS to which the end user is connected to obtain details of the end user's session. If the end user's session is not up and running, the test ends here. Otherwise the test examines whether the PPP session terminates on the BRAS or not. If the session terminates on the BRAS, the xDSL IP test commands the BRAS to ping the IP address associated with the end user's router / modem and the results are displayed for the CP via WOOSH.
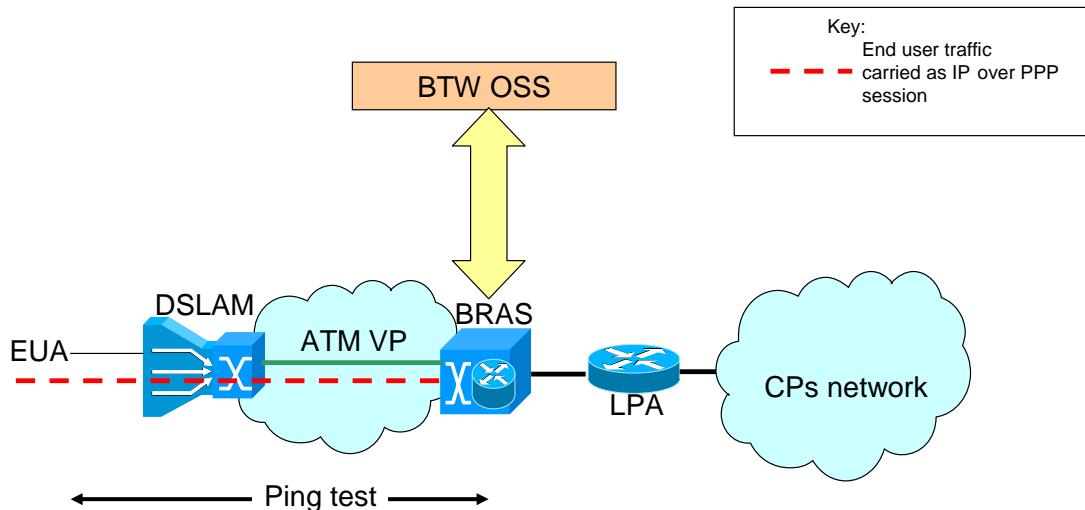

Figure 3. xDSL IP test for end user where PPP session is terminated on the BRAS

If the PPP session is tunnelled further into the network then the test logic ascertains the tunnel end point using information from the BRAS. At this point there is a check to see whether the CP has opted into end to end diagnostics for the xDSL IP test. If the CP has not, then the xDSL IP test goes no further. If the CP has opted into end to end diagnostics then BT's OSS will attempt to communicate with the CP's OSS via XML and in essence ask the CP's OSS for results for a ping test from the tunnel end point to the end user in question. This information is then presented back in the results of the xDSL IP test (e.g. as part of the WOOSH one shot check).
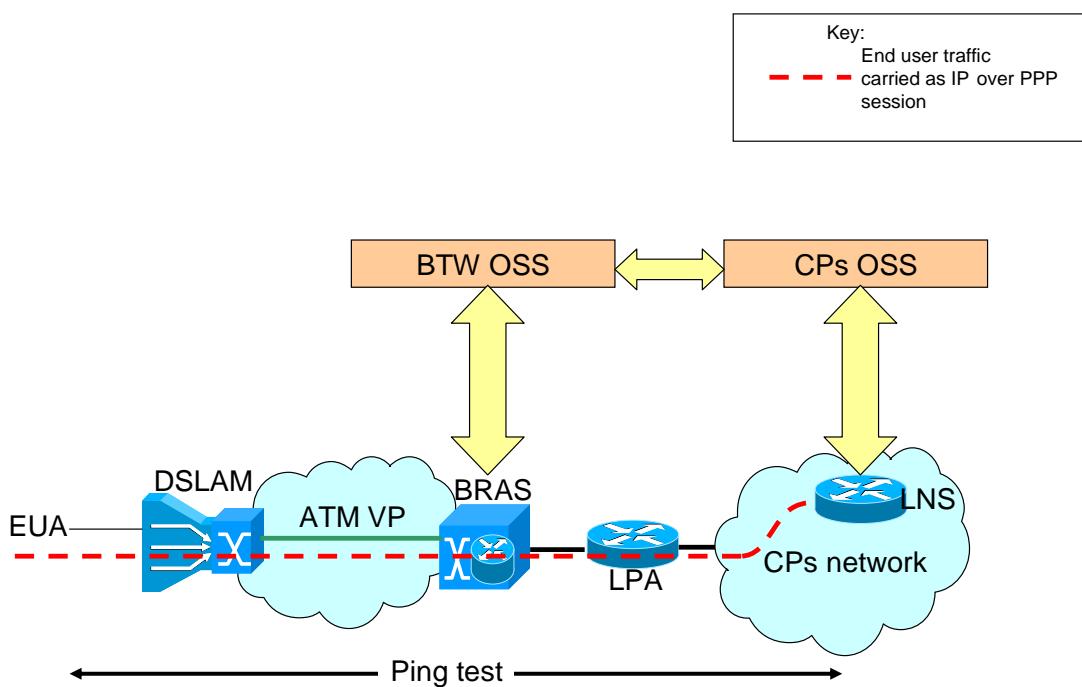

Figure 4. xDSL IP test for L2TP end users, where CP has opted into end to end diagnostics

5.3 Performance tester

The performance tester is used to help identify situations where there is a slow speed fault within the network by downloading a file across the end user's connection from the performance tester web server (accessed by typing https://speedtest.btwholesale.com/ into a web browser running on the end user's PC). The performance tester web pages guide the end user through the test.

The performance test uses the end user's normal login credentials and connection path, and provides an initial view as to whether there is a problem somewhere between the end user and the public internet accessible part of BT's IP network where the performance tester is hosted. The path that the end user's traffic will take will depend on whether the end user's PPP session is terminated on the BRAS or tunnelled into the CP's network.

If the end user's PPP session terminates on the BRAS, the traffic will take the path as indicated in the diagram below:

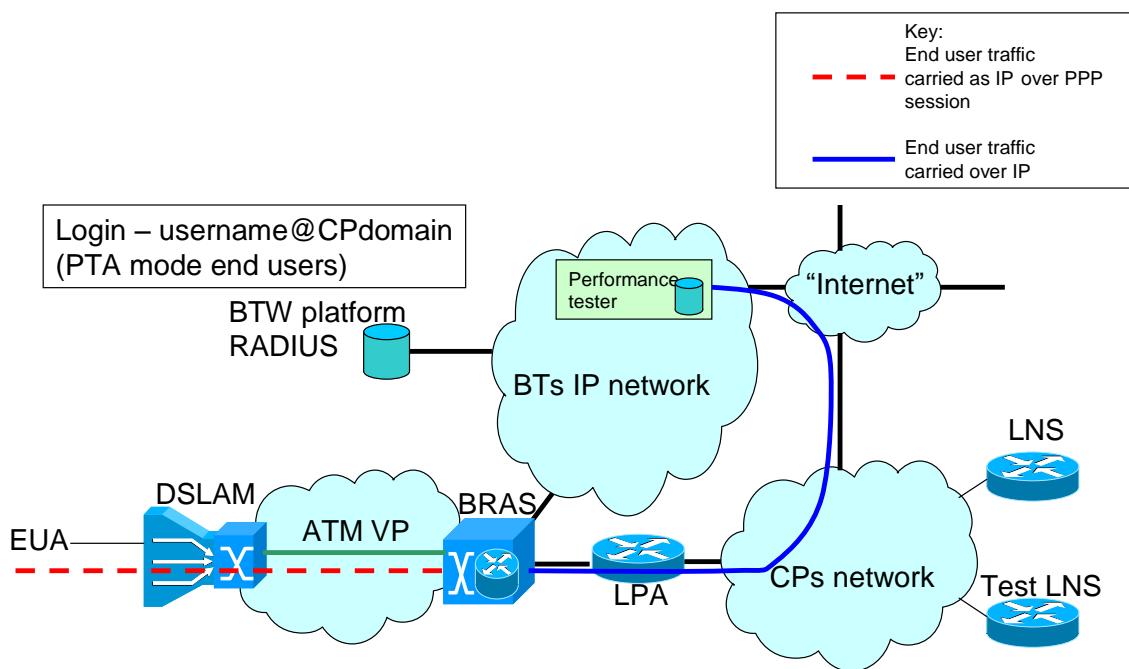

Figure 5. Performance test for PTA end users

If the end user's PPP session is tunnelled into the CP's network, the traffic will take the path as indicated in the diagram below:
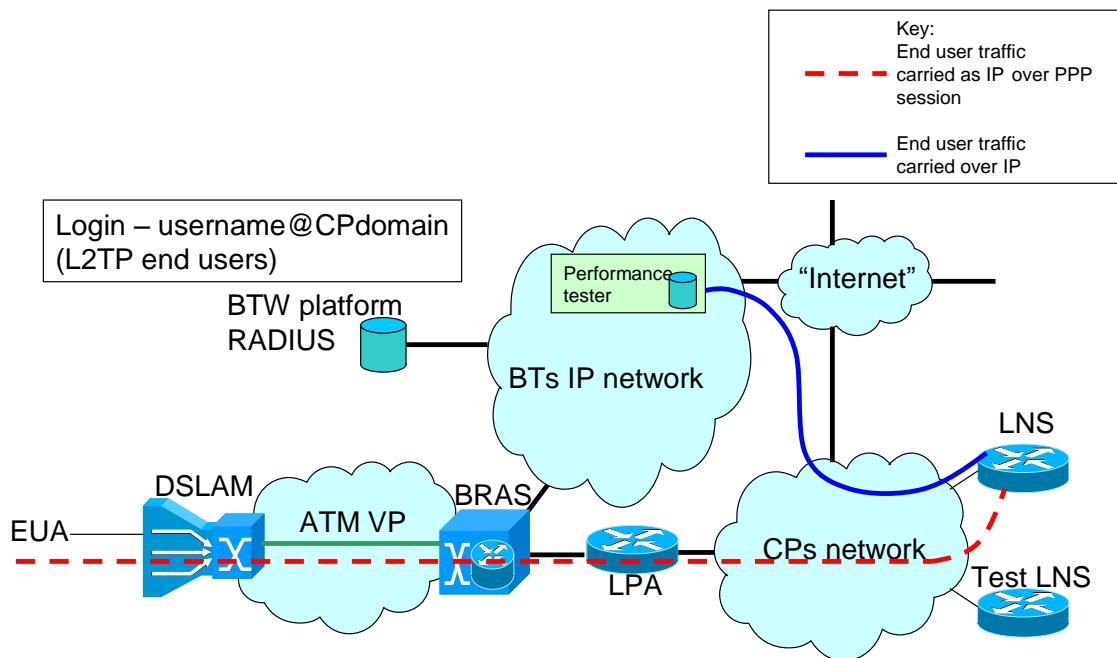

Figure 6. Performance test for L2TP end users

.

For a second performance test (which does not apply to end users whose PPP session normally terminates on the BRAS) the end user is asked to login as bt_test_user@<cpdomain>, where <cpdomain> is their normal login domain / realm / SSN. As far as the BT platform is concerned, the BT platform RADIUS only inspects the SSN when determining tunnel end points, so when the end user attempts to login as bt_test_user@cpdomain, the RADIUS will instruct the BRAS to tunnel the end user's PPP session as if the end user had logged in using their normal username. It is up to the CP to determine whether to terminate the end user on a different part of their network if it detects the end user has logged in with the bt_test_user username.

It should be understood that the webpage will direct the end user to type these details into their router / modem, so it is strongly advised that the CP should at least terminate a PPP session logging in with these details, even if the session is terminated in the same way as the user's normal login credentials.
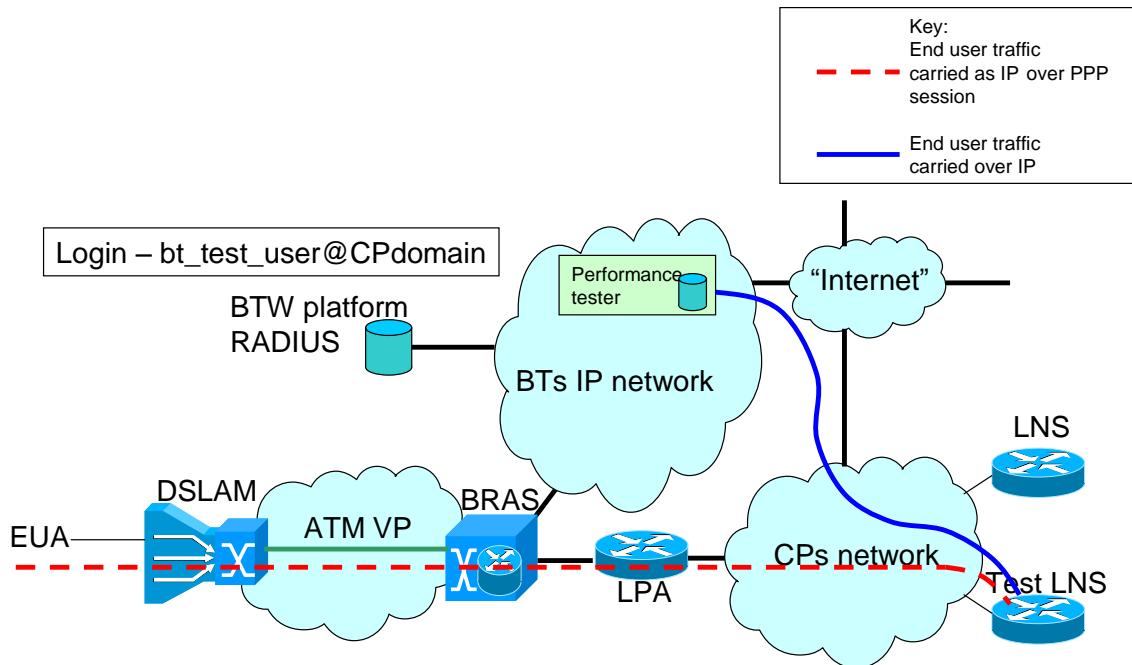

Figure 7. Performance test connecting to optional test LNS within the CP's network

Once the end user has connected using the new login credentials a file download is carried out and throughput to the end user ascertained.

For performance test TAP3, the end user is asked to re-configure their router modem to login as speedtest@speedtest_domain. This prompts the BT network to terminate the session on one of a specific pool of IP addresses at the BRAS. The user has limited access from these IP addresses but from one of these IP addresses the user can access the performance tester from within BT's network without traffic being routed over the connectivity to the CP's network. This is illustrated in the diagram below:
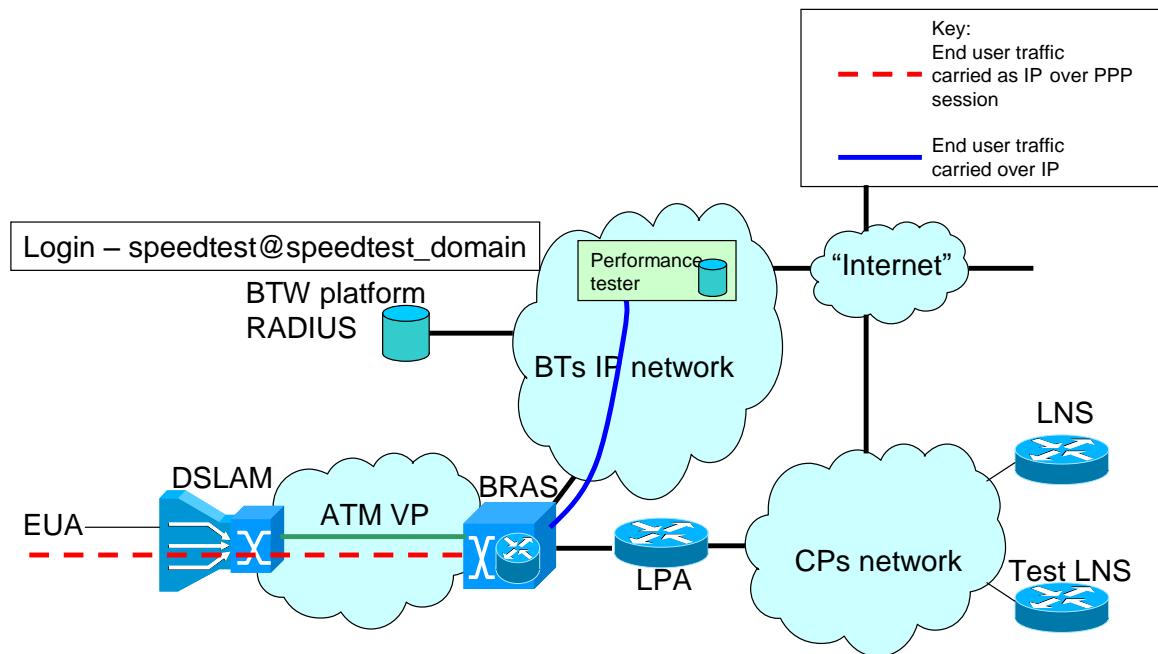

Figure 8. Performance test "TAP3"

Again, a file download is carried out to ascertain the throughput experienced on the end user's service. A slow speed here indicates a problem with the BT network and the result will be stored to support further investigation.

8. History

Date	Issue	Comment
12 March 2008	1.0	First Issue
1 May 2008	1.1	Amended and clarified references to MSIL documentation
19 June 2008	1.2	Amended to incorporate references to new IPStream Connect SINs 485 & 487. Also minor corrections have been made under Routing Protocols (Section 3.3.4) and Geographic-based delivery (Section 4.3).
19 November 2008	1.3	Added new section "IPstream Connect Diagnostic Options". This provides clarity on existing test & diagnostic considerations, and does not introduce any new features..
19 December 2008	1.4	Correction to wording section 3.3.2. Removed aggregated billing, and replaced with node billing.
September 2009	1.5	Modifications to the following sections: 1. Changes to SIN references and wording 3.3.2 Clarification to commercial arrangements 3.3.3 Clarification on use of MSIL 3.3.4 Clarification to routing protocols, 4.1 Clarification of L2TP & PTA service 4.2.4 Clarification of L2TP authentication 4.3 Clarification of Accounting attributes 4.4 Clarification of RADIUS IP address type General – minor wording changes
November 2009	1.6	3.3.3 - Modified to highlight handover link limit – 8 pairs of links per node maximum and all links at a node must be the same size. Also clarified 21C handover option. 3.3.4 – Clarification on load-balancing for PTA mode 4.2.2 & 4.2.4 – Modified to reflect that the proxy-state attribute may be included in the access reject. General – minor wording changes
March 2010	1.7	3.3 – Minor changes to section numbers

		3.3.6 - Clarified the use of L2TP control packets
		3.3.7 - Added Link Tagging option
September 2010	1.8	1. – Wording change for the Symmetric service
		3.3.4 – Clarified the number of CP RADIUS servers supported for Authentication & Accounting
		4.2.4 – Clarified that the timeouts are relevant for PTA customers only
		4.6.1 – Removed Domain Name-less option as no longer supported. Made a wording change.
		3.3.4, 4.1, 4.2.2 & 4.2.4 – Introduced description of PTA Multiple Address Pools functionality.
October 2010	1.9	1., 3.3.4, 5.2, 5.3 & Appendix A - Included the introduction of Content Connect
November 2010	1.10	1. & Appendix A - Minor wording changes
		4.1 – Clarified two current PTA Multiple Address Pool restrictions
May 2011	1.11	1., 4.2 & 6. – Introduced L2TP Session Steering option and referenced SIN 502
		4.2 – Clarified the Authentication options
		1., 6. & Appendix A - Updated reference from STIN 504 to SIN 504
January 2012	1.12	Section 1, Appendix A – Removed references to Content Connect Basic; removed references to SIN 504 and introduced reference to CDN Integration and User Guide;
		Appendix A – Minor change to wording for handling of IP Address Ranges & Content Connect charging
April 2013	1.13	Section 1., 4.2.2 & Appendix A – Removed references to Advanced Services
December 2015	1.14	Section 1, 3.3.4, 5.2, 5.3, 6 and 7. – Changes to reflect the withdrawal of Content Connect
		Appendix A – Content Connect Appendix removed

		Change SINet site references from http://www.sinet.bt.com to http://www.btplc.com/sinet/
July 2020	1.15	Change SINet site references from http://www.btplc.com/sinet/ to https://www.bt.com/about/sinet
September 2020	1.16	Section 1 and 3 updated to reflect the old IPstream Centrals product and IPstream Symmetric no longer being available. Section5.3 Performance Test URL and functionality

Table A.1 provides a *brief* description of the *major* changes between this issue of Suppliers' Information Note xxx [insert number[and the previous issue. Please refer to the main body of the document for full descriptions of each topic.
